

**AMENDMENTS TO THE CLAIMS.**

Claims 1-24 (CANCELLED).

25. (CURRENTLY AMENDED) An applicator according to claim 26, wherein:

~~each of said needles comprising a base with a rod, a sharpened portion, and a head;~~

~~—said rod having its central elongated axis disposed in a first predetermined direction, and having a diameter which is oriented perpendicular to said first predetermined direction;~~

~~—said head being wider than the diameter of said rod, and all said heads having their major planar surface disposed in one and only one flat plane which is oriented perpendicular to said first predetermined direction and to said central elongated axis of said rod;~~

~~—said needle bases being made of steel, copper, chromium, nickel, or silver, and provided with a coat made of chromium, nickel, copper, or silver;~~

at least a portion of said needles being made with solid and/or partial coats;

and

in the case of partial ~~coating~~ coat of said needle ~~bases~~, the areas ~~close to said adjoining to their sharpened portions thereof are formed by~~ made of at least two materials ~~having which have~~ different electrochemical potentials[[:]].

~~said needle bases and coats are made of chemical elements selected from a group additionally including cobalt, aluminum, magnesium, zinc, tin, titanium, vanadium, beryllium, gold, platinum, palladium, strontium, tellurium, and alloys and oxides thereof; and~~

~~—said needles are arranged in said applicator in such a way that adjacent needles comprise different base and coat materials.~~

26. (CURRENTLY AMENDED) An applicator for use in reflexotherapy, comprising:

[[an]] a flat elastic base member;

a plurality of needles fixed in [[the]] said base member;

each needle comprises a core, a sharpened portion, and a thickened portion;

said thickened portions are fixed in said base member in such way that the sharpened portions protrude from the base member;

one or more ~~portions~~ groups of [[the]] said needles [[are]] have a partially coated core;

one or more ~~portions~~ groups of [[the]] said needles have multilayer coatings of said core and sharpened portion;

one or more ~~portions~~ groups of [[the]] said needles differ from the other ~~portions~~ groups by the materials they are produced of or by the coating materials, which have different electrochemical potentials;

[[the]] said needles and their coatings are fabricated from materials selected from a group comprising steel, copper, chromium, nickel, silver, cobalt, aluminum, magnesium, zinc, tin, titanium, vanadium, beryllium, gold, platinum, strontium, tellurium or their alloys and oxides; and

each of said needles [[are]] is placed on the base member in such way that ~~each needle is surrounded by needles, the sharpened portions of which protrude from the base member to the surface, contacting with an user's epidermis, comprised from the materials and/or coating with different electrochemical potentials.~~ adjacent needles are made from materials

and/or their alloys with different electrochemical potentials and are designed for contacting an user's skin.

27. (NEW) An applicator for use in reflexotherapy, comprising:

a base member;

a plurality of needles fixed in said base member;

each said needle comprising a rod member having a sharp portion at a first end of said rod member, and a head portion at a second end thereof;

said head portion being wider than said rod member;

said rod member having a central longitudinal axis disposed in a first predetermined direction;

all head portions of said needles having major planar surfaces in a flat plane perpendicular to said first longitudinal axis of said rod member;

said needles being fixed in said base member so that said sharp portions protrude from said base member;

said rod member being made from a base material;

said needles including one or more first needles made from and/or coated with a first material, and one or more second needles made from and/or coated with a second material;

one or more third needles made from and/or coated with a third material having a different electrochemical potential than that of said first and second materials;

the coating on at least one of said needles comprises a multilayer coating of different materials;

the material in said needles and/or coatings being selected from steel, copper, chromium, nickel, silver, cobalt, aluminum, magnesium, zinc, tin, titanium, vanadium, beryllium, gold, platinum, palladium, strontium and tellurium or alloys or oxides thereof;

said first and second materials having different electrochemical potentials;

each said needle being surrounded by needles having base materials and coatings made from different materials;

said needles being arranged in said base member in a configuration whereby, when adjacent needles having sharp portions are exposed to a surface of contact with a user's epidermis, said sharp portions are either coated with and/or are made from different materials; and

said partially-covered needles expose a surface of contact between each needle and the user's epidermis to at least said first and second materials.

28. (NEW) An applicator for use in reflexotherapy, comprising:

a base member;

a plurality of needles fixed in said base member;

each said needle comprising a rod having a sharp first end and a head on a second end fixed in said base member so that said sharp first end protrudes from said base member;

said rod having a longitudinal axis;

said head being wider than said rod, and all heads of said needles having major planar surfaces disposed in one flat plane perpendicular to said longitudinal axis of said rod;

said needles being partially covered with a coating;

the coating on at least some of said needles comprises a multilayer coating of different materials;

the material in said needles and/or coatings is selected from steel, copper, chromium, nickel, silver, cobalt, aluminum, magnesium, zinc, tin, titanium, vanadium, beryllium, gold, platinum, palladium, strontium and tellurium or alloys or oxides thereof;

said needles including at least a first set of needles made from and/or coated with a first material, and a second set of needles made from and/or coated with a second material;

said first and second materials having different electrochemical potentials, whereby, in use, a surface of contact between each needle and a user's epidermis is exposed to at least said first and second materials having said different electrochemical potentials;

at least one additional set of needles being made from and/or coated with another material having a different electrochemical potential than said first and/or second set of needles;  
and

said needles being arranged in said base member in a configuration whereby adjacent needles having sharp first ends exposed to the surface of contact with the user's epidermis are either coated with and/or made from different materials.

29. (NEW) An applicator for use in reflexotherapy comprising:

- a base member;
- needles fixed in said base member;
- each of said needles comprising a rod having a sharp first end and a head at a second end thereof;
- each said needle being fixed in said base member so that said sharp first end protrudes from said base member;
- said rod having a longitudinal axis;
- said head being wider than said rod;
- all heads of all needles having major planar surfaces disposed in one flat plane perpendicular to said longitudinal axis of said rod;
- at least a portion of said needles being made with solid and/or partial coatings;
- in the case of partial coating of the rods, areas near the sharp first ends including at least two materials having different electrochemical potentials;
- needle rods and coatings being made of material selected from the group consisting of copper, chromium, nickel, silver, cobalt, aluminum, magnesium, zinc, tin, titanium, vanadium, beryllium, gold, platinum, palladium, strontium and tellurium or alloys or oxides thereof; and
- the needles being arranged in the base member in a configuration such that adjacent needles comprise different rod and coating materials.
